6. PROJECT DEVELOPMENT PHASE

Project tittle: Multi-Line Insurance Policy and Claims Management System

Team Members:

MOHAMED ABDHULLA Z - Team Lead

KRISHNA PRIYAN.V - Team Member

YUVARAJ P - Team Member

Phase 1: Requirement Analysis & Planning

Objective

The main objective of this phase is to understand the requirements of the Multi-Line Insurance Policy and Claims Management System and plan the Salesforce implementation.

Insurance companies manage different types of insurance policies such as Life, Health, Motor and Property Insurance. Managing customer details, policy information, premium payments and claims through separate systems can make the process difficult and time-consuming.

The proposed system provides a centralized Salesforce platform where customer information, insurance policies, claims and payment details can be managed efficiently. The system also provides AI-based assistance through AgentForce AI for policy and claims-related queries.

Key Activities

- Collect requirements from customers, insurance agents, claims officers and administrators.
- Identify the major users of the system such as Customer, Insurance Agent, Claims Officer and Admin.
- Define the scope and objectives of the project.
- Identify insurance policy creation, management and renewal requirements.
- Identify claim registration, verification, processing and status tracking requirements.
- Design the data model using Customer, Insurance Product, Policy, Claim and Payment objects.
- Identify the Salesforce tools required for development.
- Plan automation using Salesforce Flows.
- Plan AI-based assistance using AgentForce AI and Prompt Builder.
- Define security requirements using Profiles and Permission Sets.
- Plan reports and dashboards for monitoring policies, claims and payments.

Phase 2: Salesforce Development – Backend & Configurations

This phase focuses on developing the backend structure and configuring the Salesforce environment for the Multi-Line Insurance Policy and Claims Management System. The required Salesforce objects, fields, relationships, tabs, Flows and AI components are configured to support insurance policy and claims management. This follows the same structure as the Salesforce Development phase in your reference document. Project Development phase.pdf

Key Activities

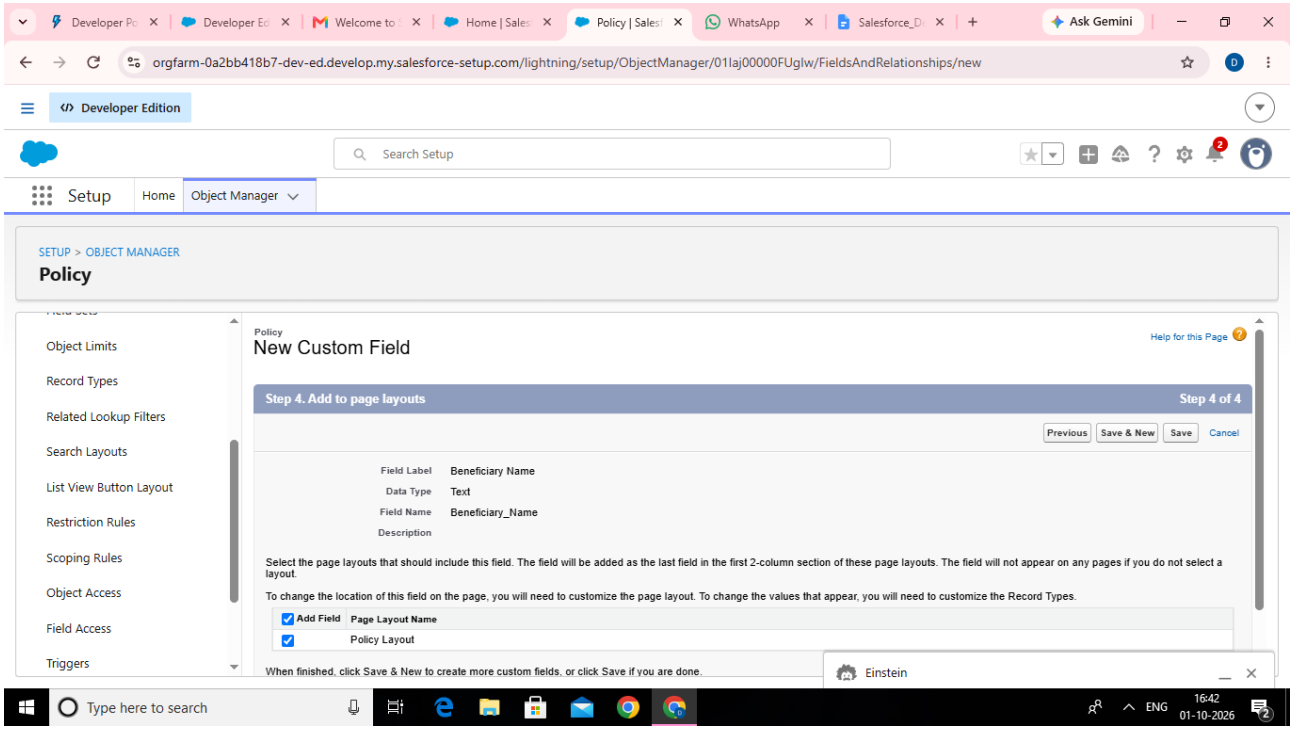

- Create and configure the Salesforce Developer environment.
- Create the required custom objects such as Customer, Insurance Product, Policy, Claim and Payment.

- Create relationships between the objects.
- Create Salesforce tabs for the project modules.
- Create fields for storing customer, policy, claim and payment information.
- Configure Salesforce Flows for process automation.
- Configure Prompt Builder for insurance policy and claims-related information retrieval.
- Configure the required backend components for policy and claims management.
- Configure the system to support multiple insurance lines such as Life, Health, Motor and Property Insurance.

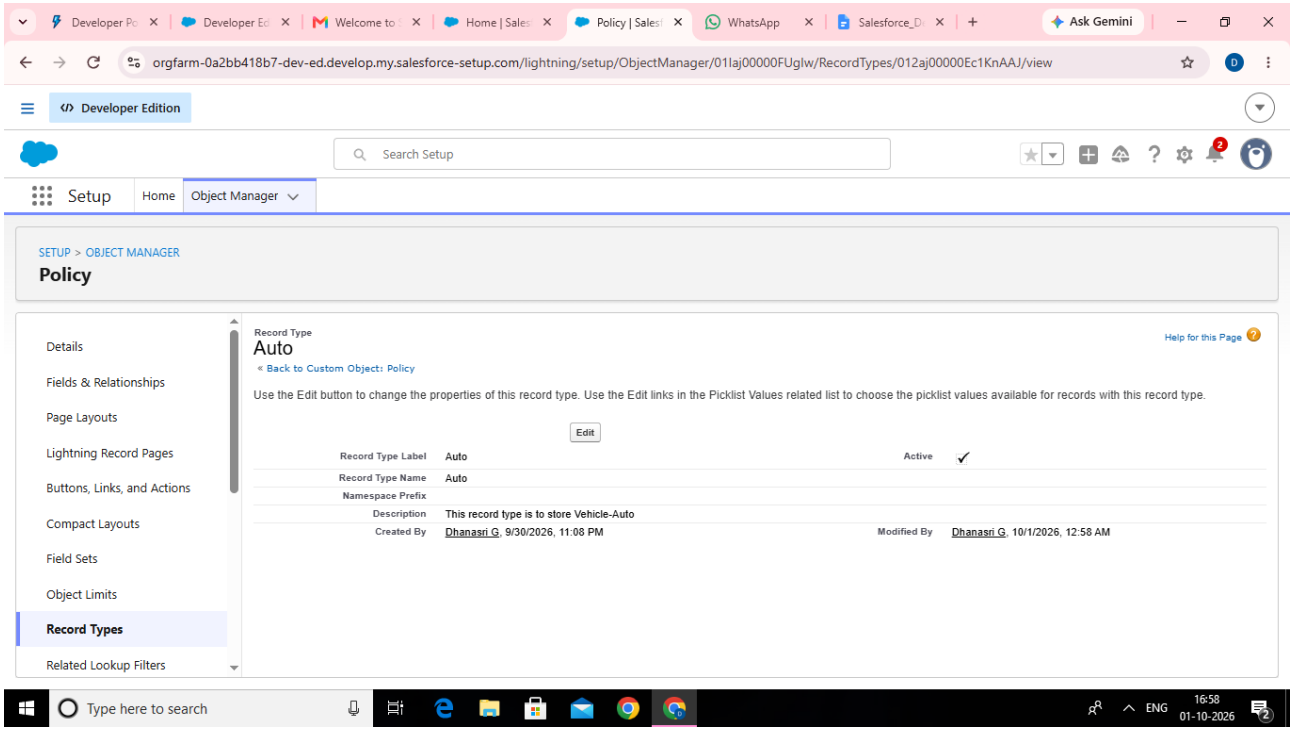

Milestone 1 – Salesforce Account

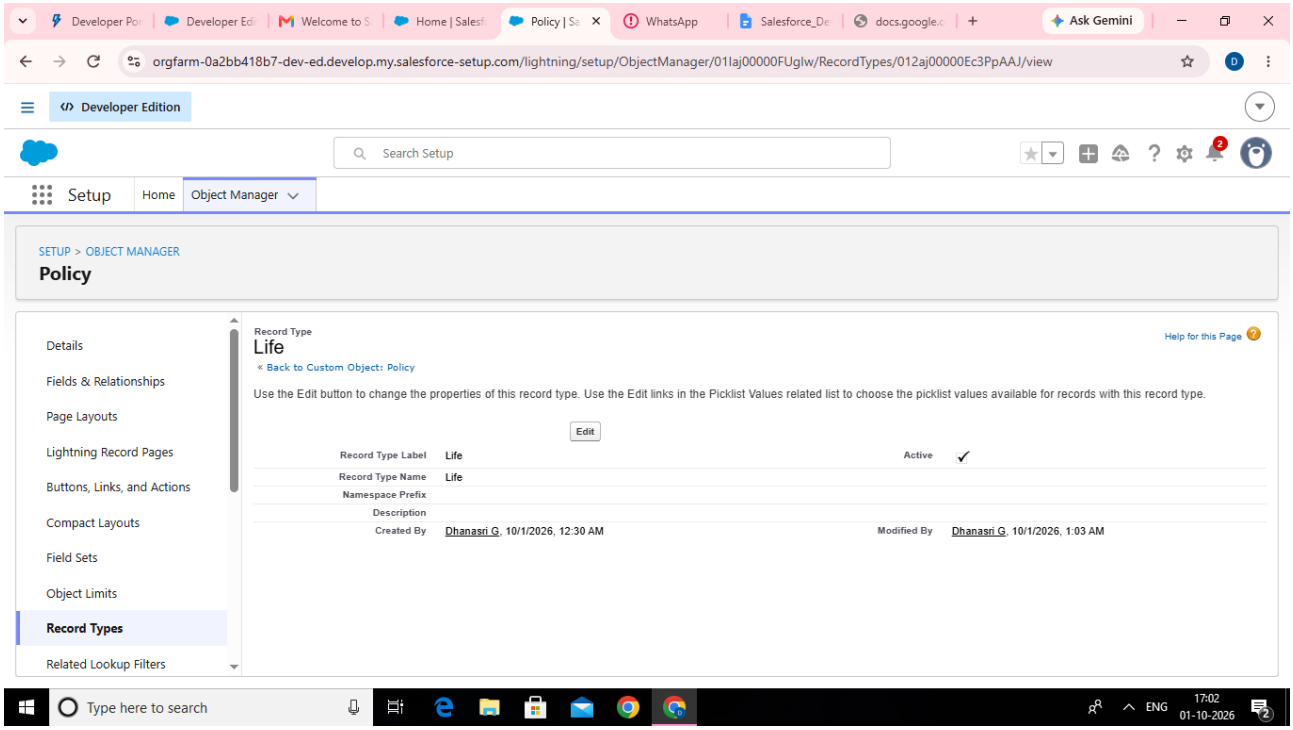

Create and configure the Salesforce Developer environment for developing the insurance policy and claims management system.

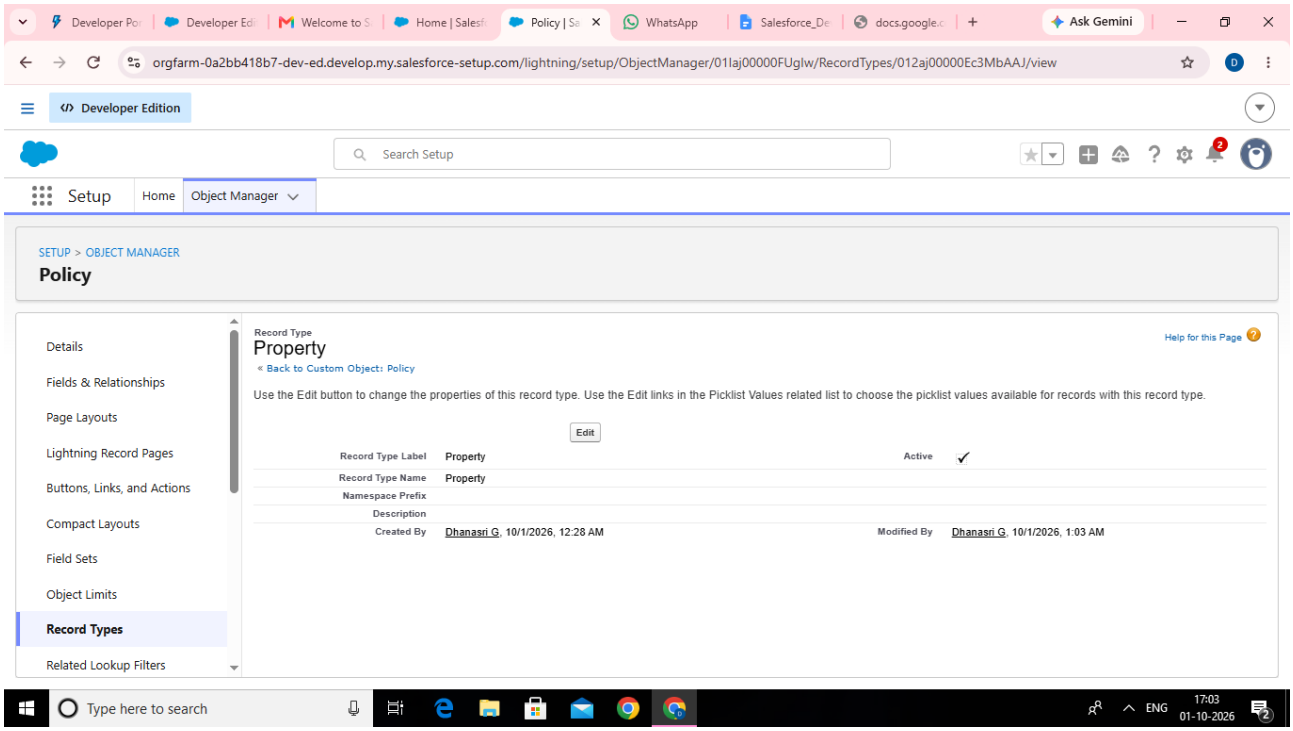

1. Create Policy custom object:

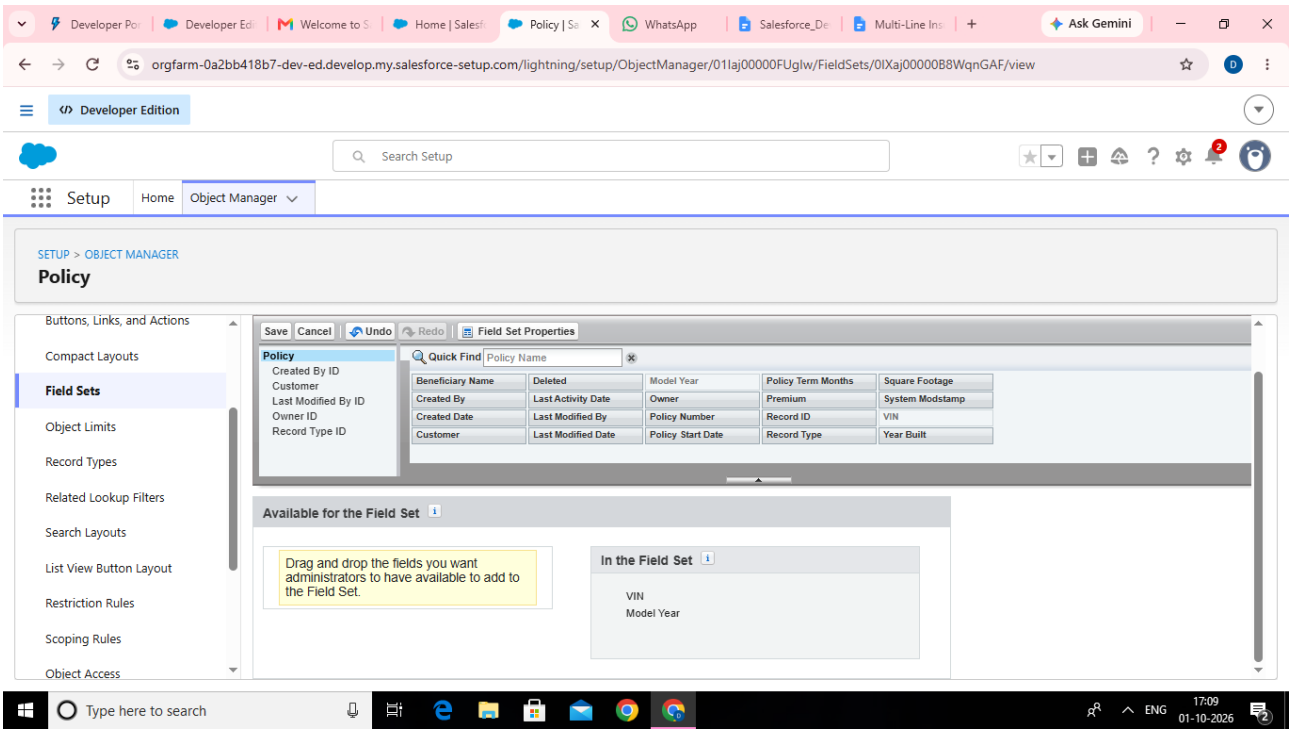

2. Define Record Types on Policy Object:

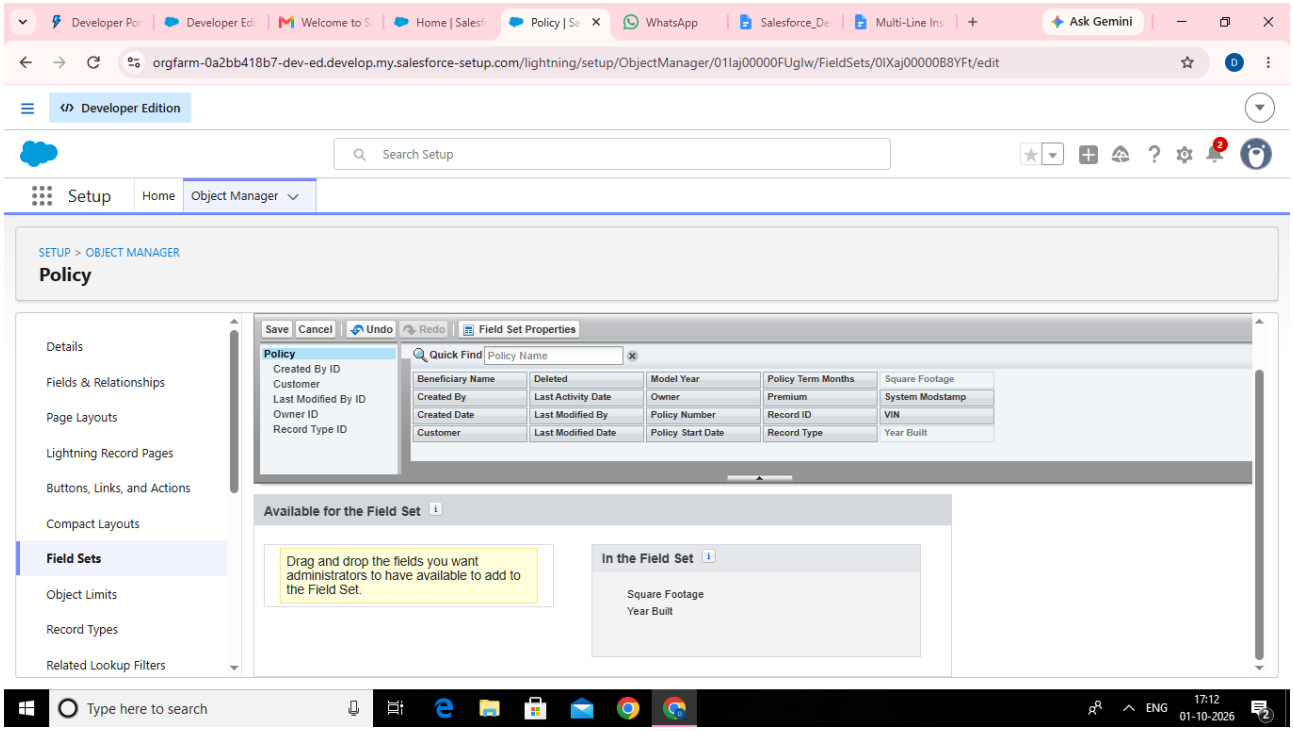

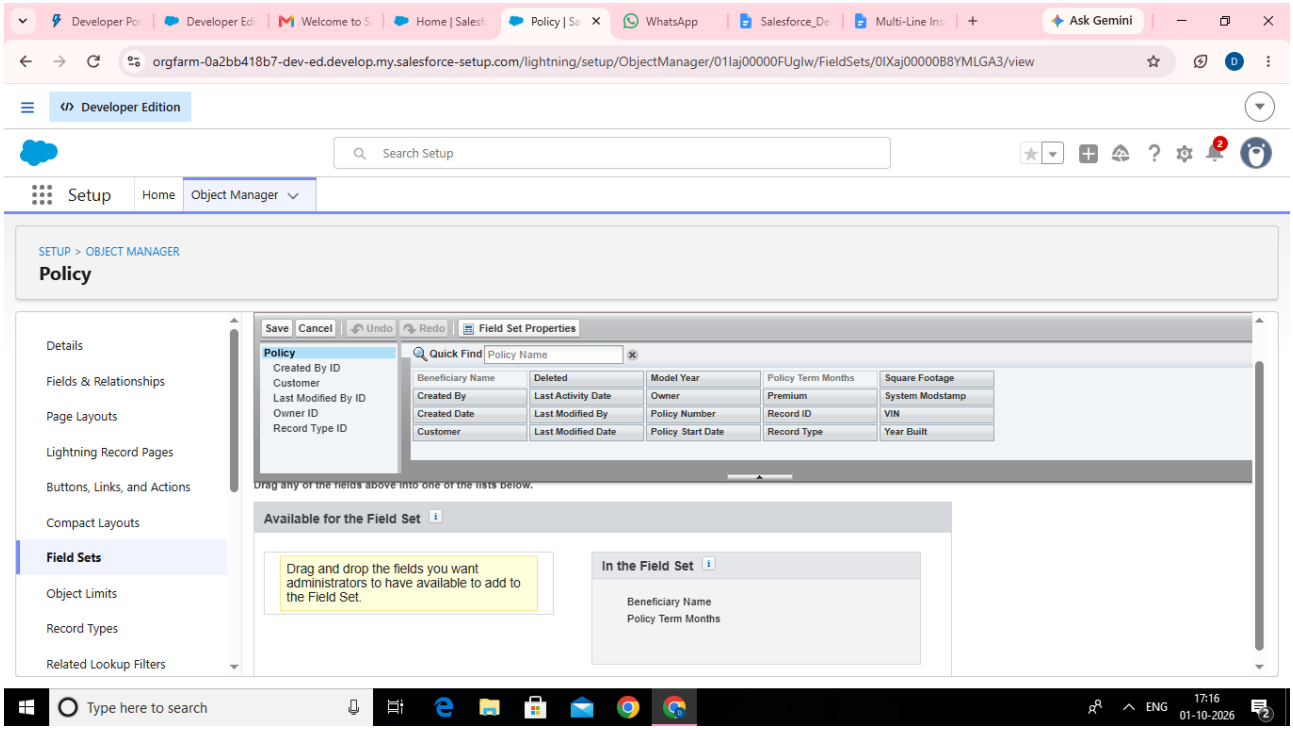

3. Create Field Sets for policy specific data:

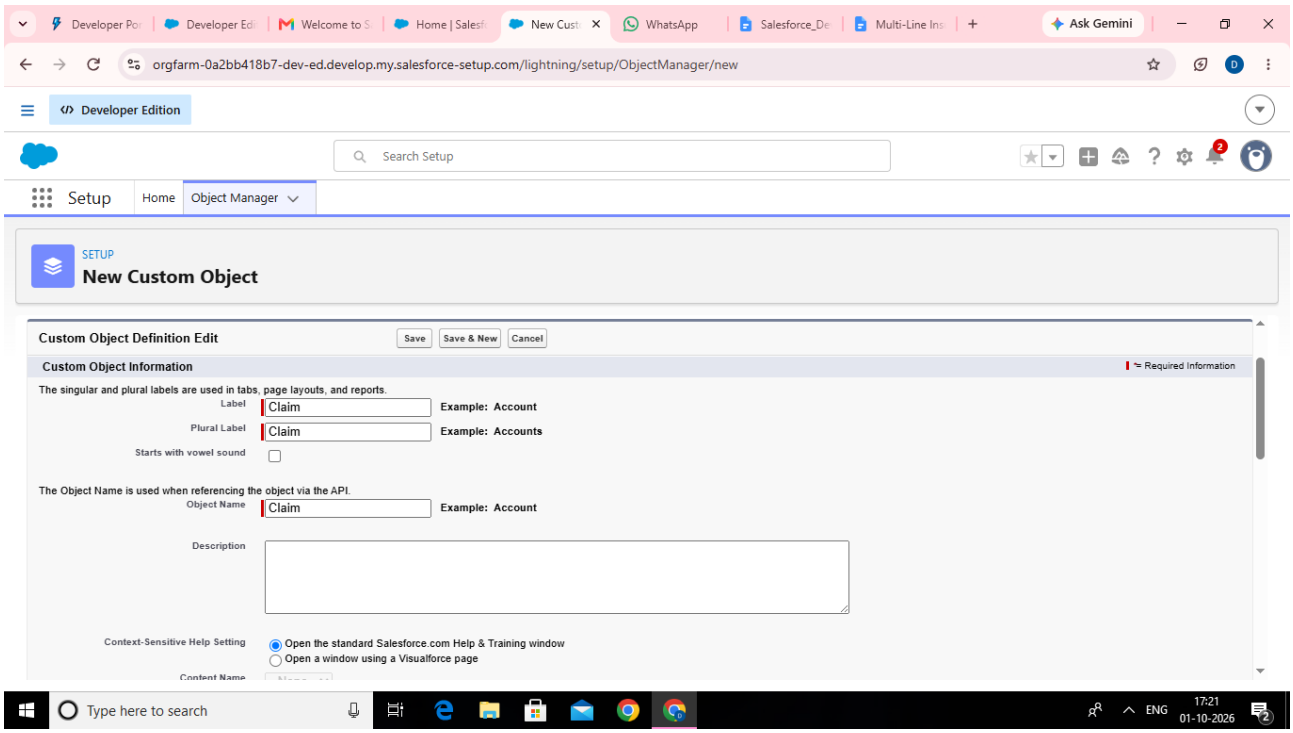

4. Property FieldSet Requires:

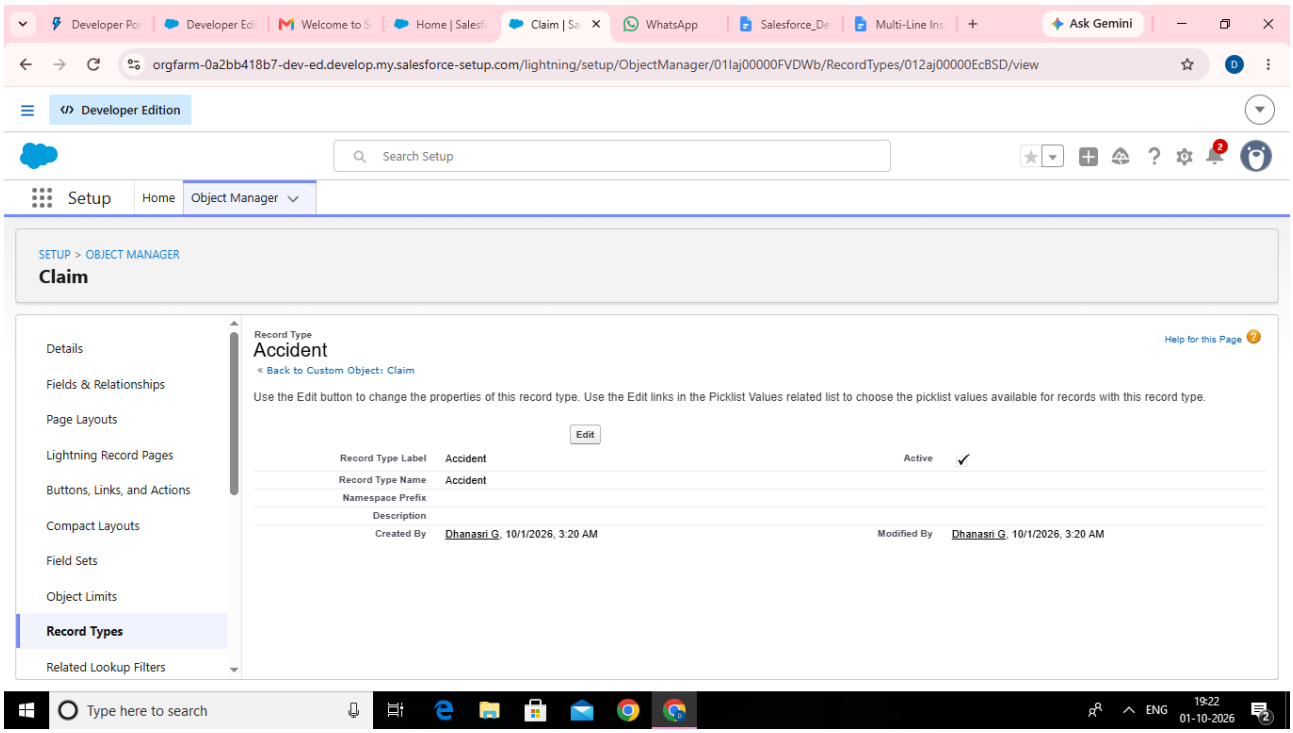

5. Life FieldSet Requires:

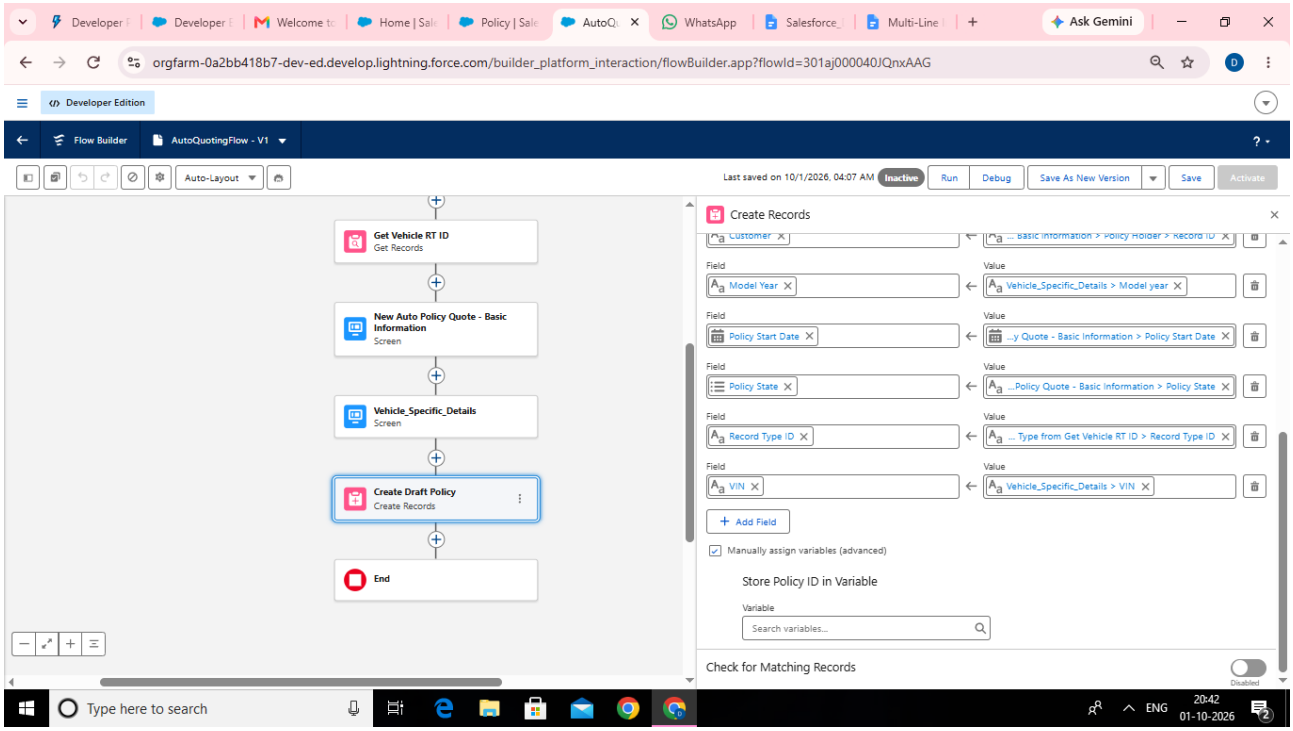

6. Create Claim Custom Object:

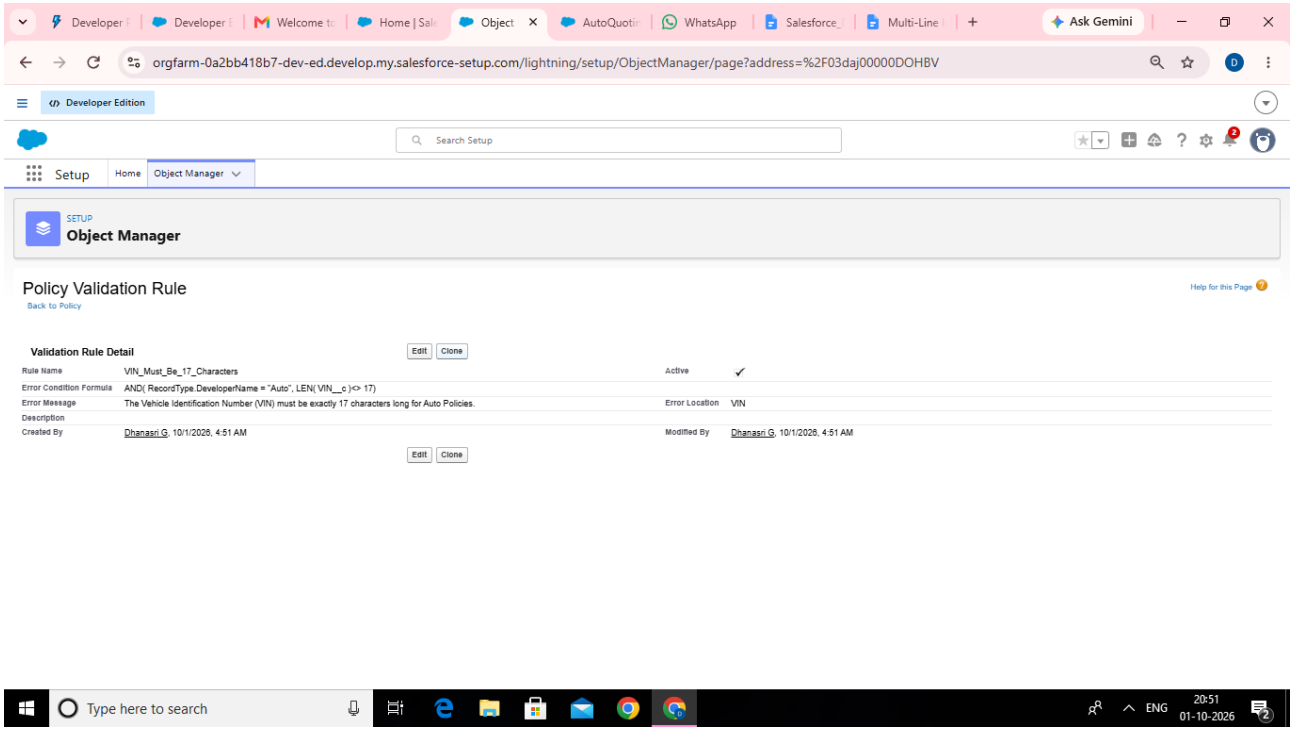

7. Define Record Types on Claim Object:

8. Create an AutoQuoting Screen Flow:

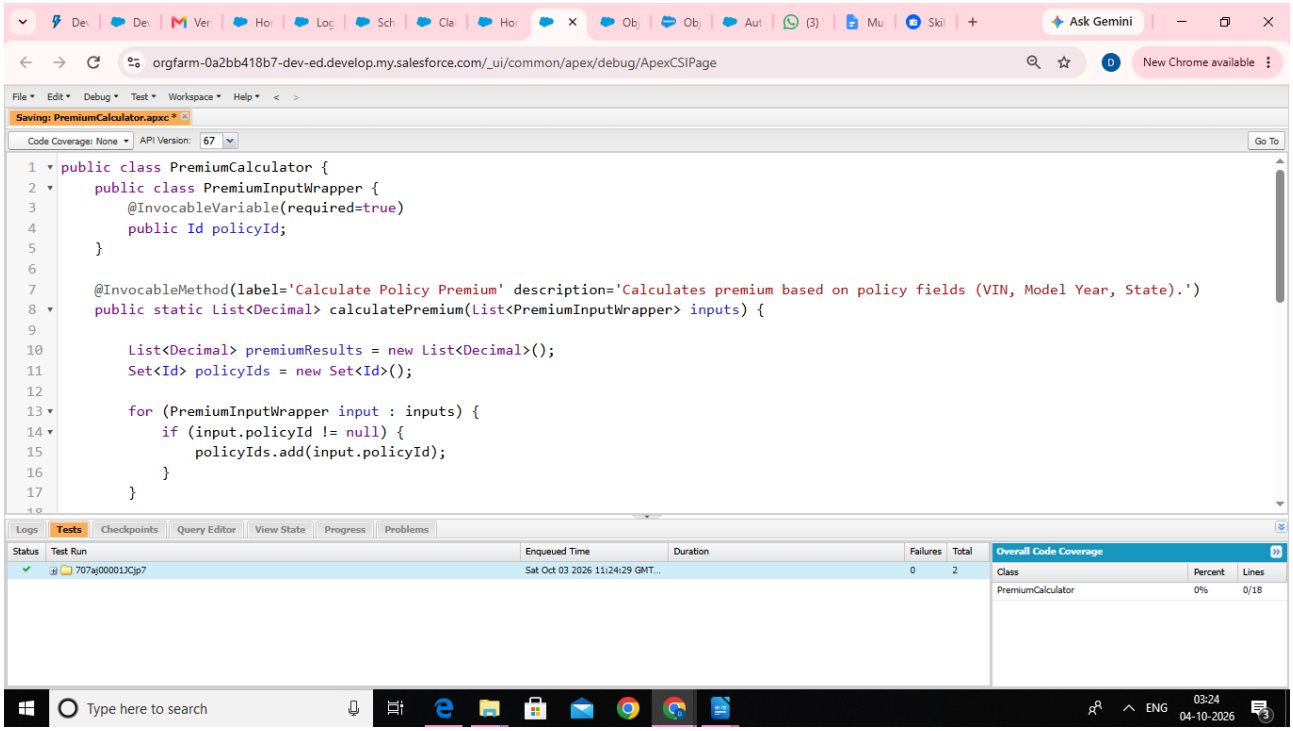

9. Create Validation Rule on Policy Object:

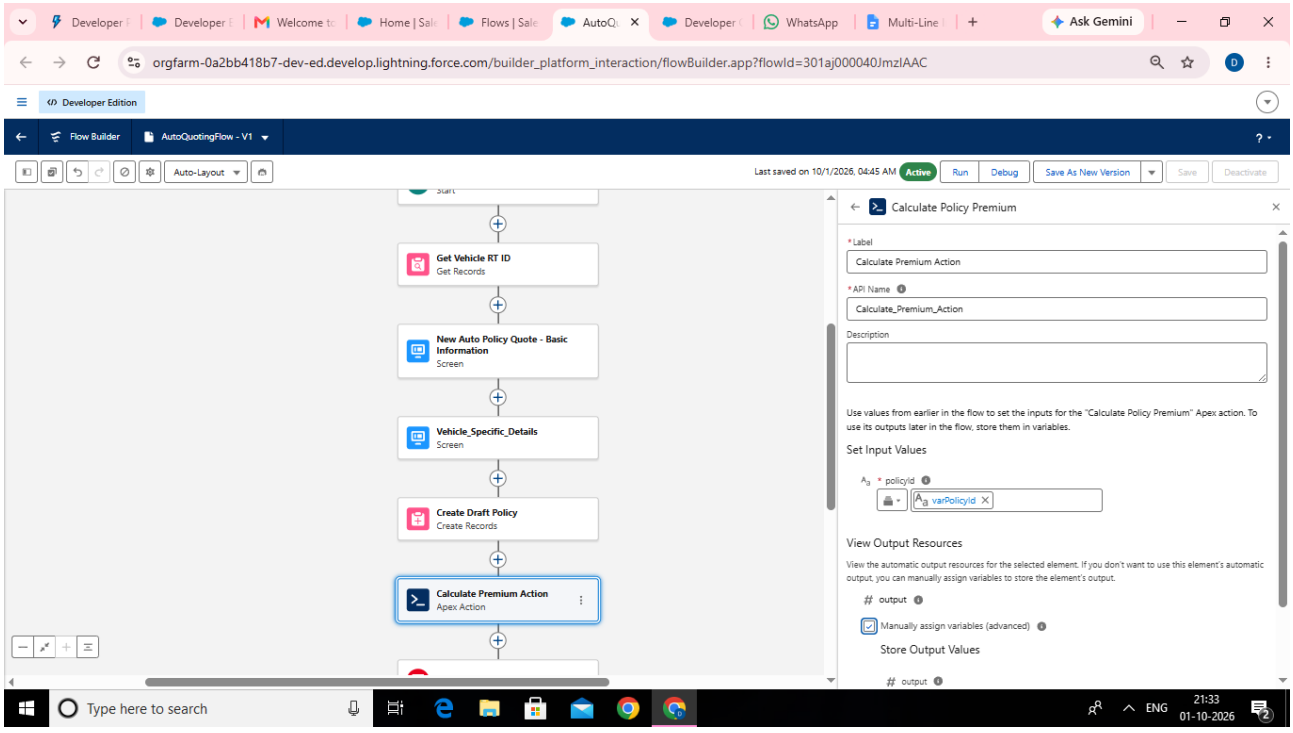

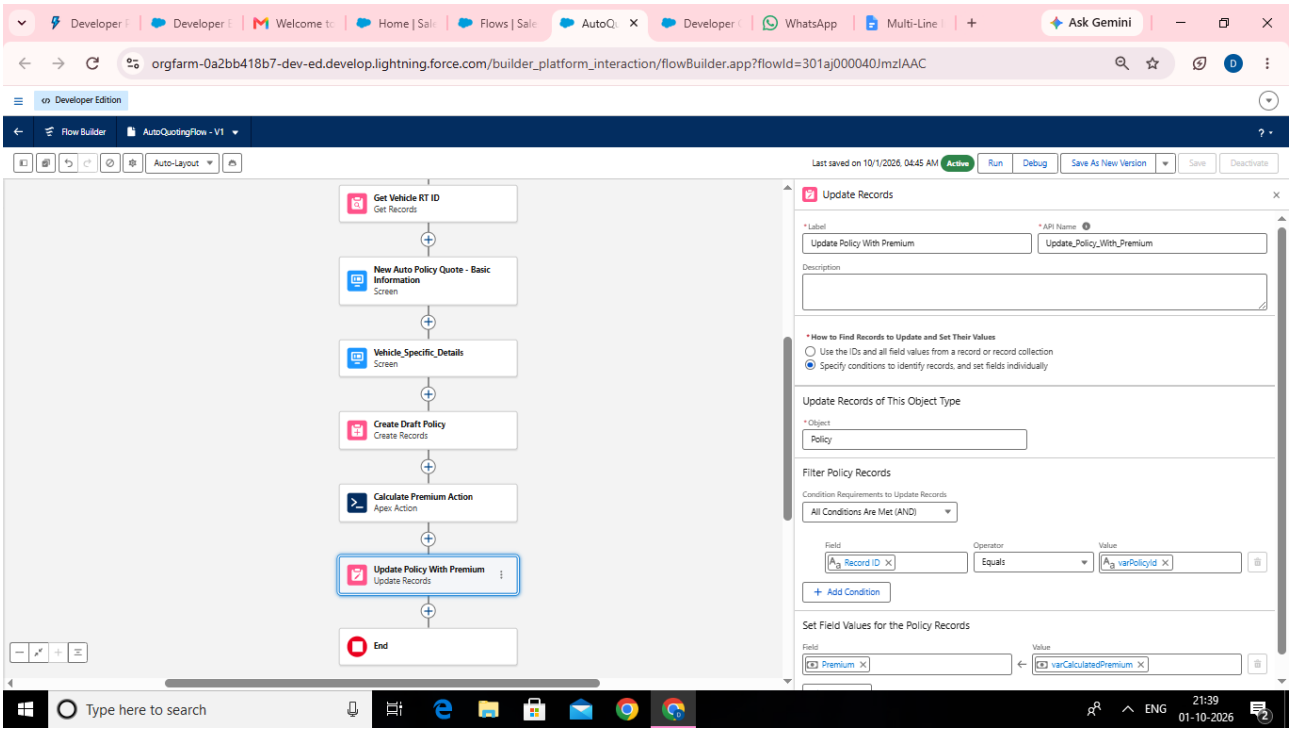

Milestone 2: Complex Policy Issuance & Claim Routing Automation

1. Create an Apex Class (PremiumCalculator) with a method that accepts policy data

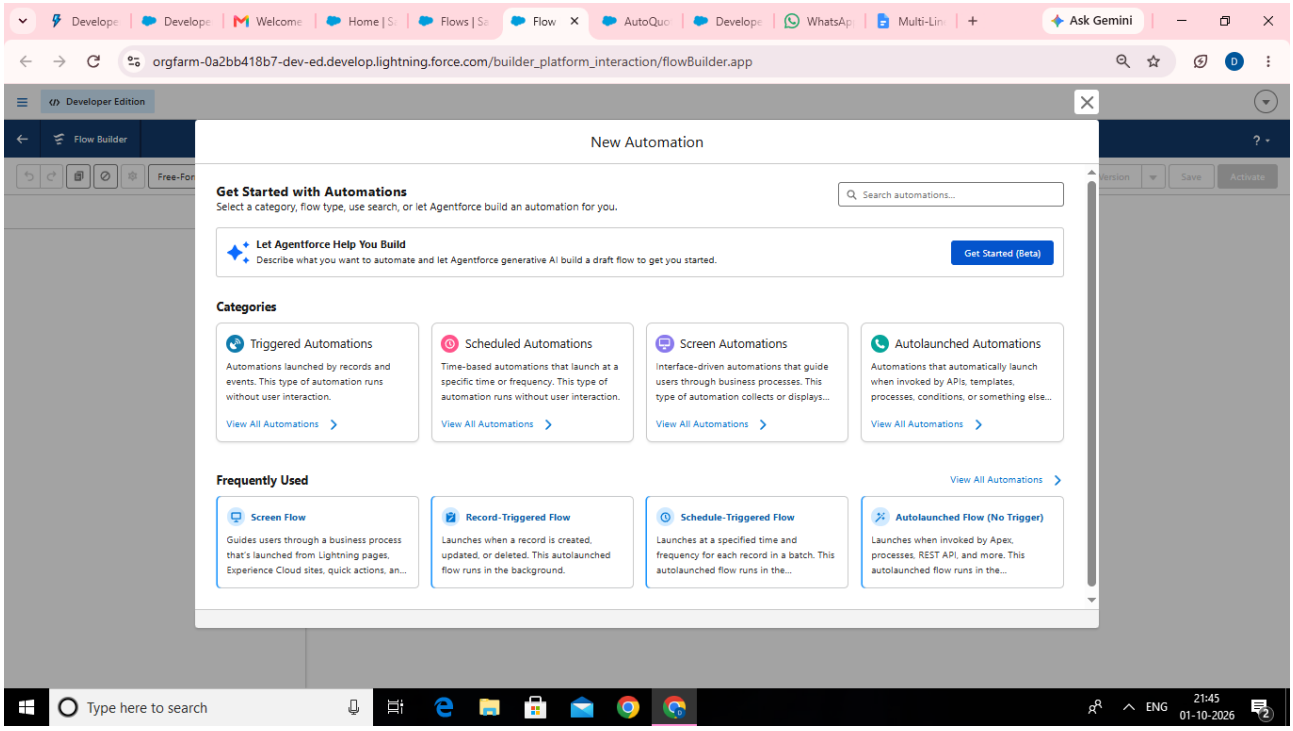

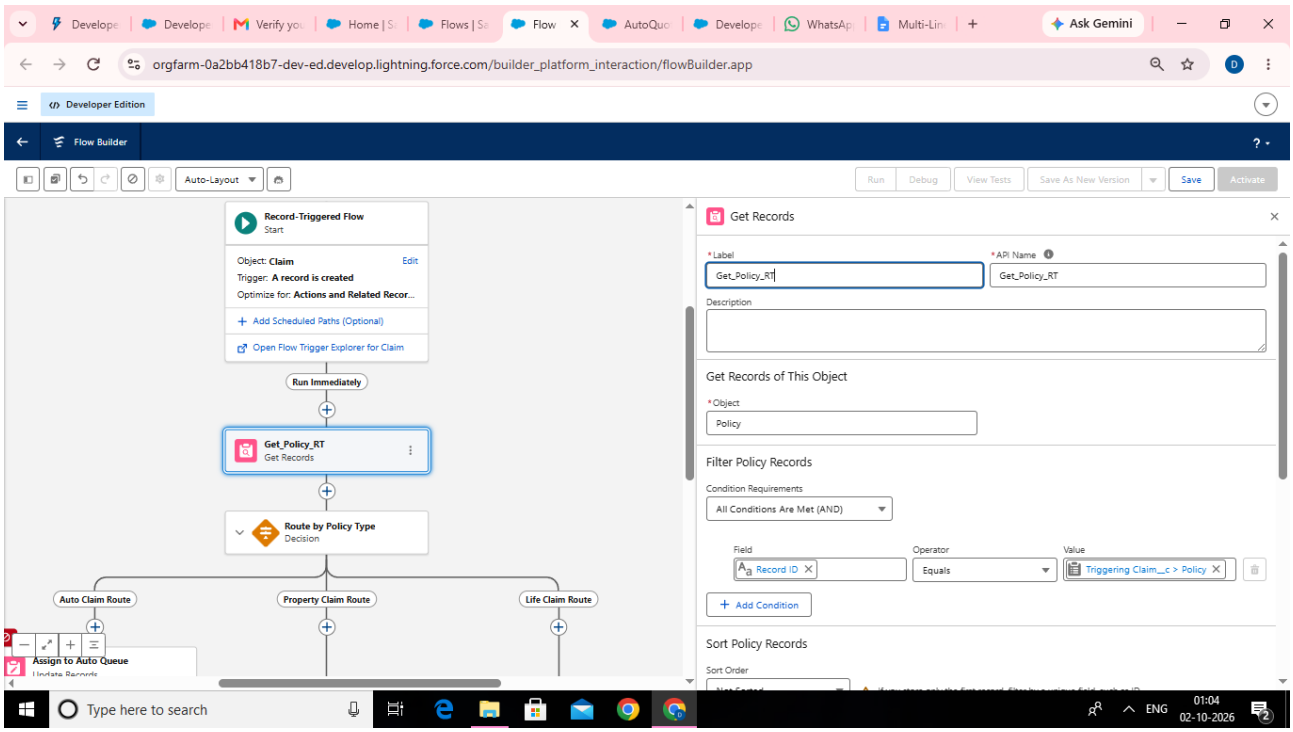

2. Integrate this Apex action into the final step of the AutoQuotingFlow to update the draft Policy record

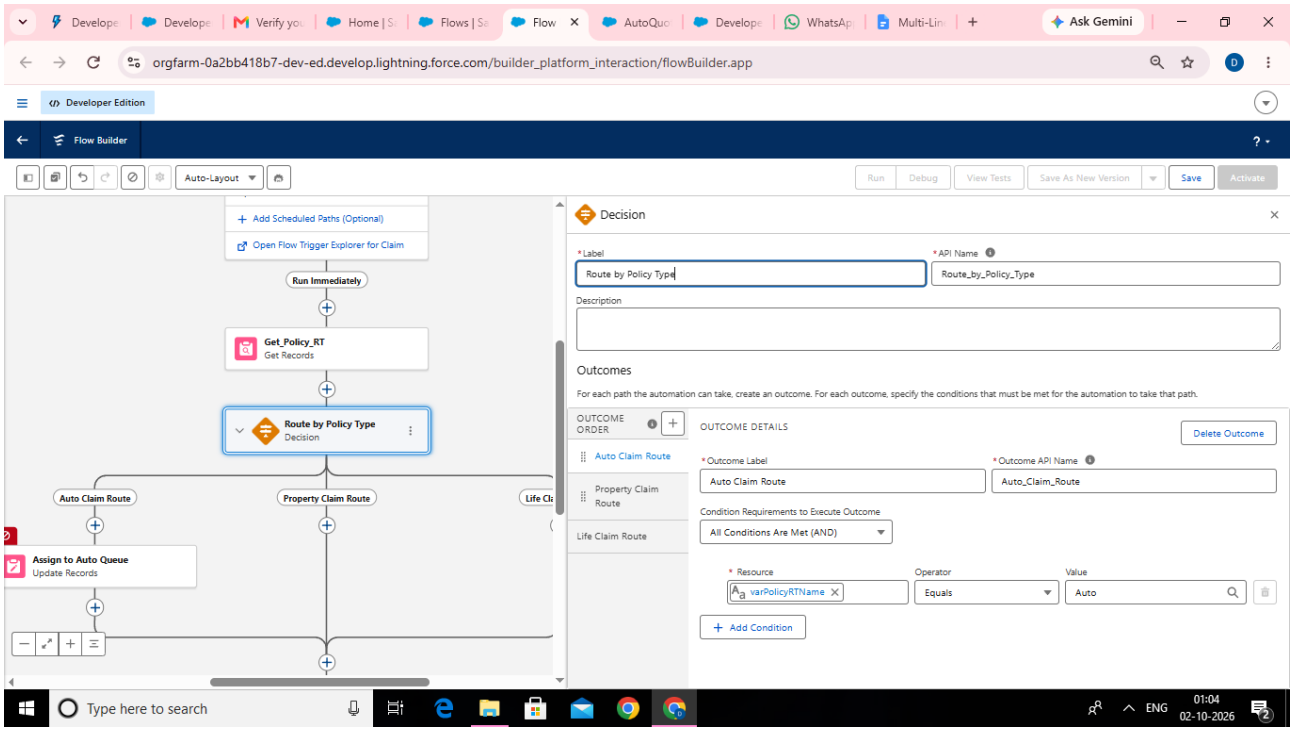

3. Create a Record-Triggered Flow (After Save) on the Claim object

Milestone 3: Claims Adjuster LWC Dashboard Development

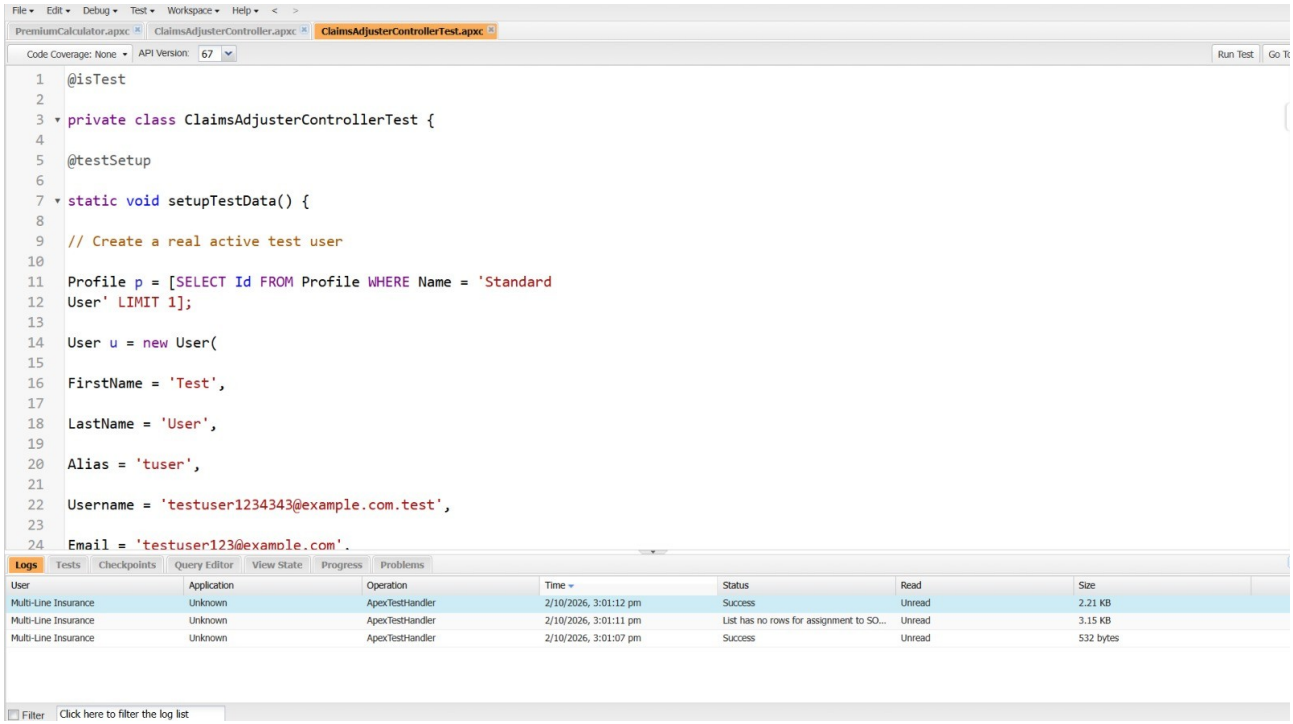

1. Create a robust Apex class (ClaimsAdjusterController) with a method using SOQL to query all Claims owned by the logged-in user, joining related Policy and Customer data. The method must return a custom Wrapper Class listing key metrics.

2. Create a component (claimsDashboardLwc) that uses the Apex method via the @wire service and implements client-side data filtering

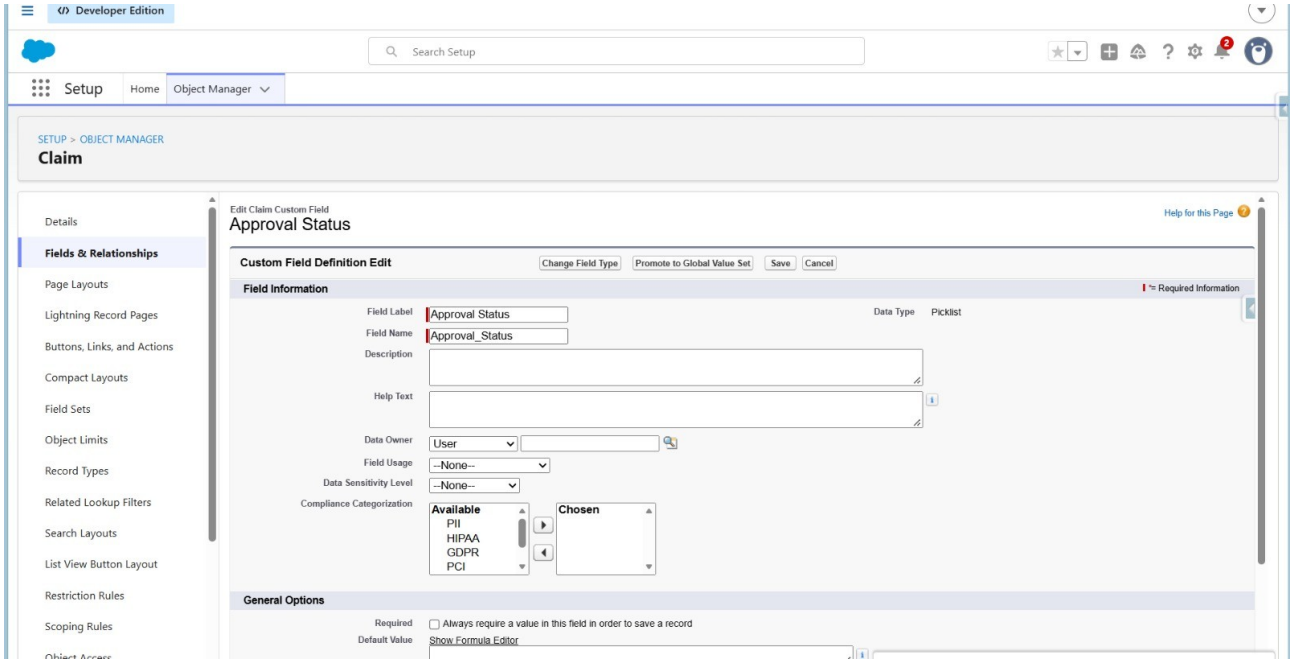

3. Create a reusable component (claimTileLwc) to display essential information for each claim

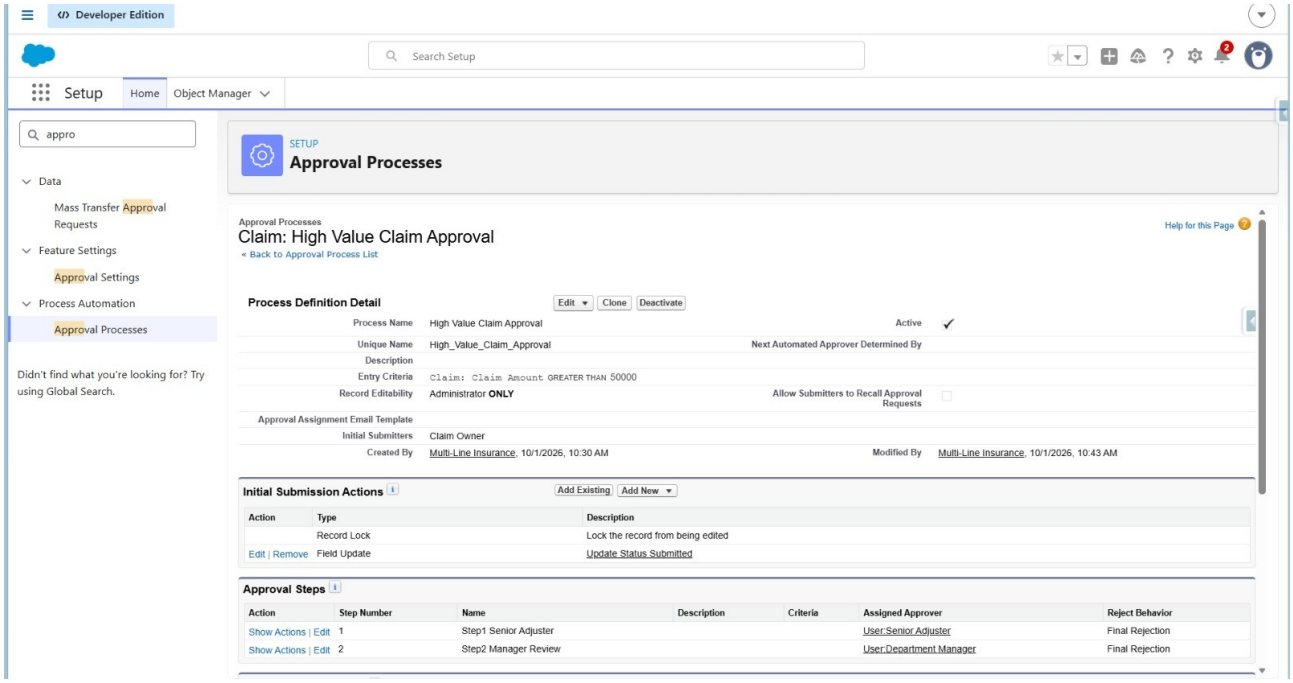

Milestone 4: Advanced Claim Processing, Security & Code Setup

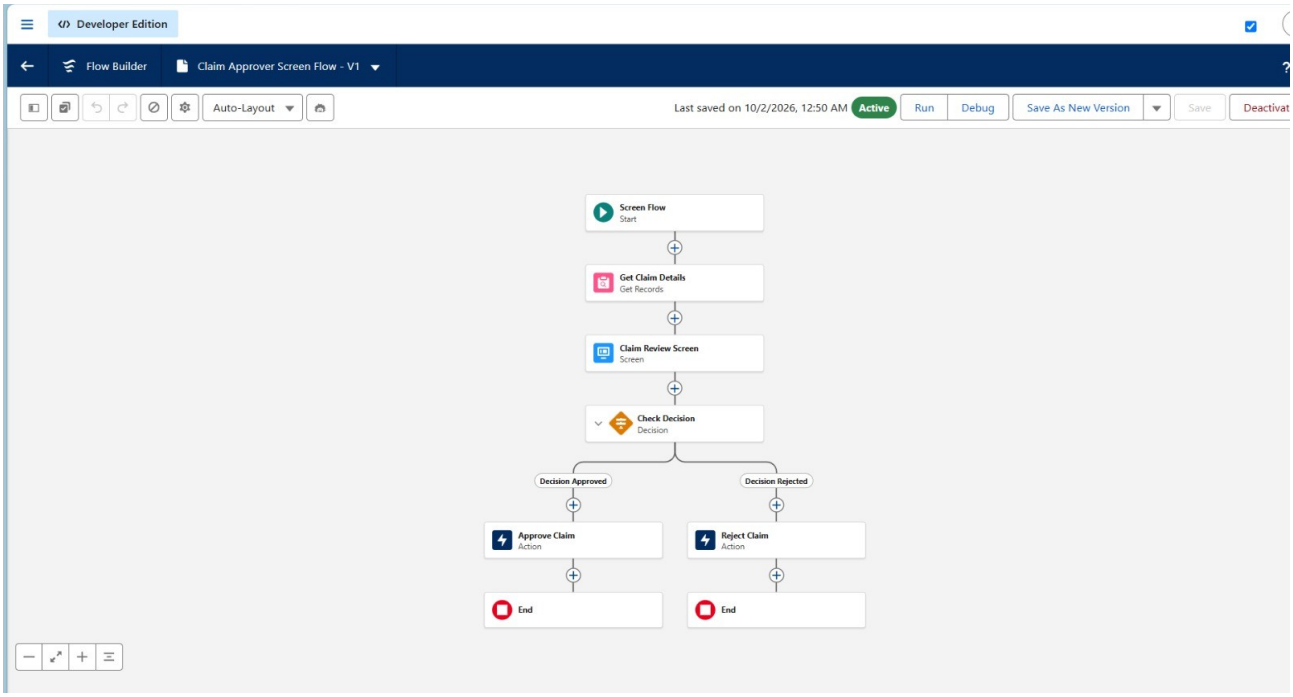

1. Modify the Claim object to include an Approval Status field.

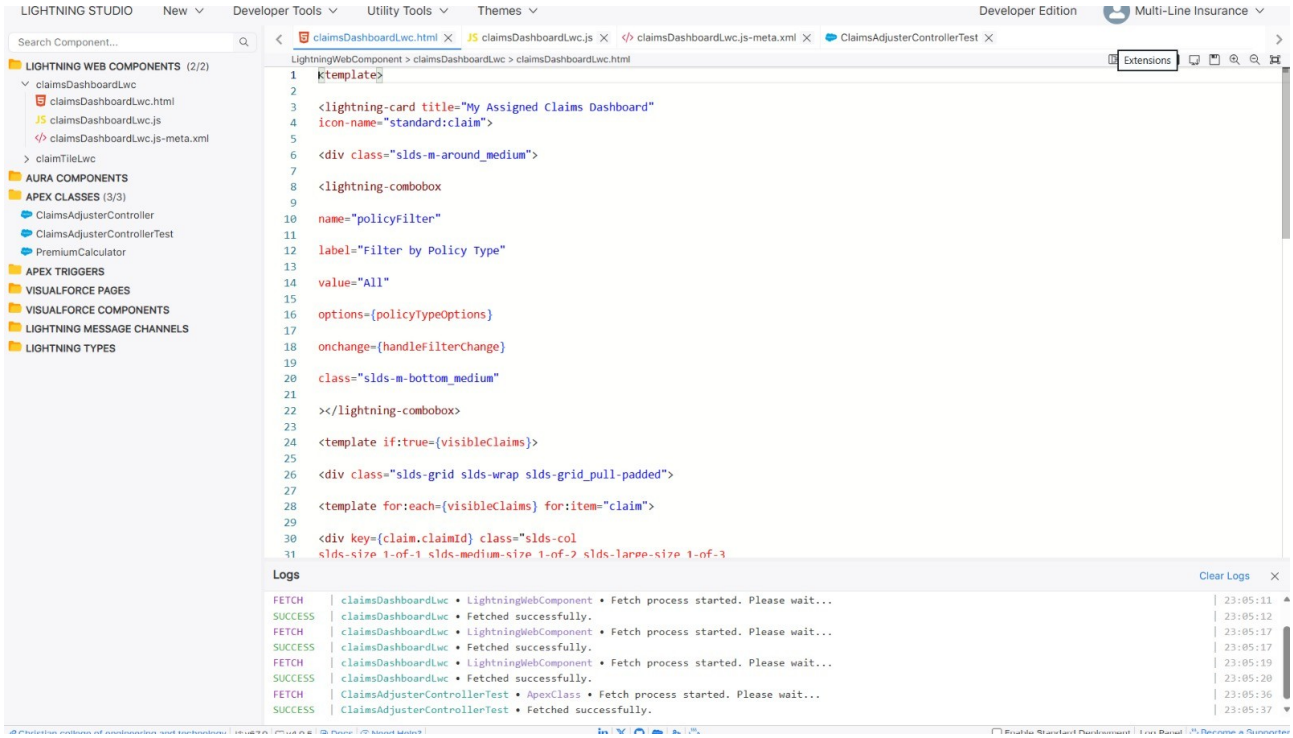

2. Configure the Approval Process to route first to the Senior Adjuster, then to the Department Manager, using two sequential steps.

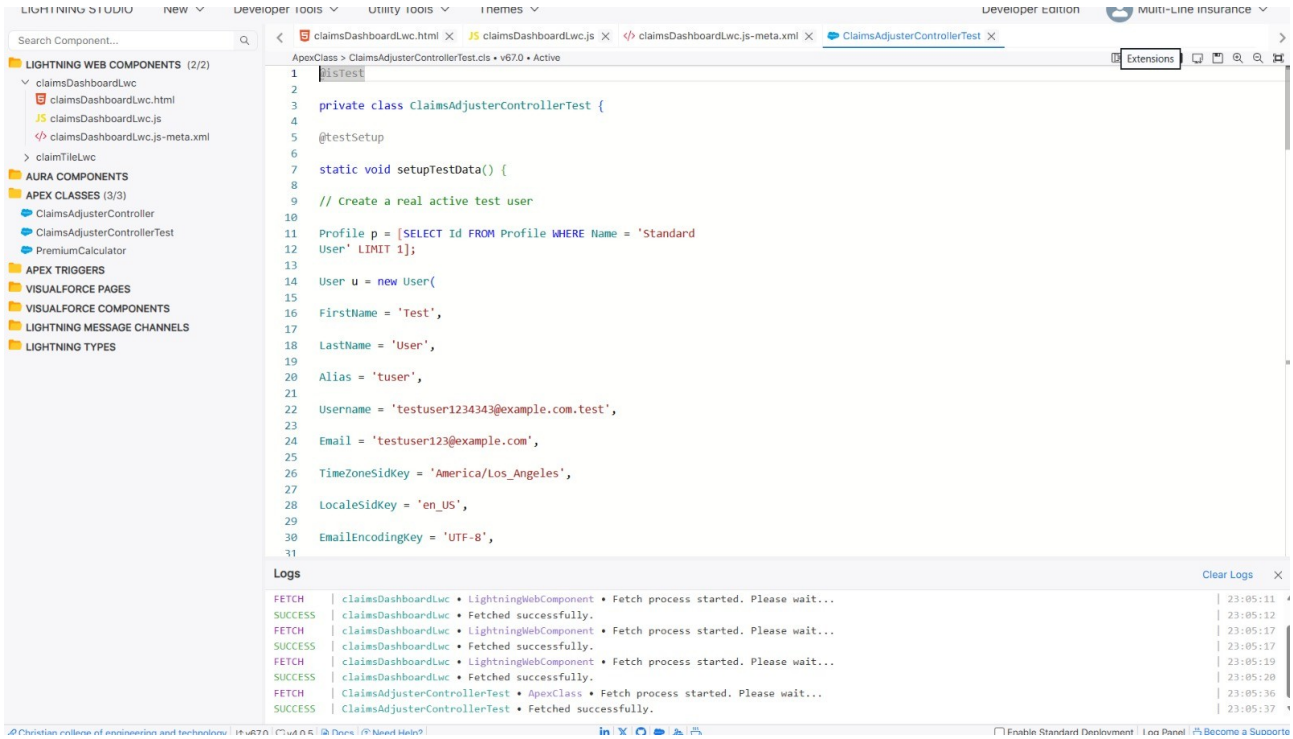

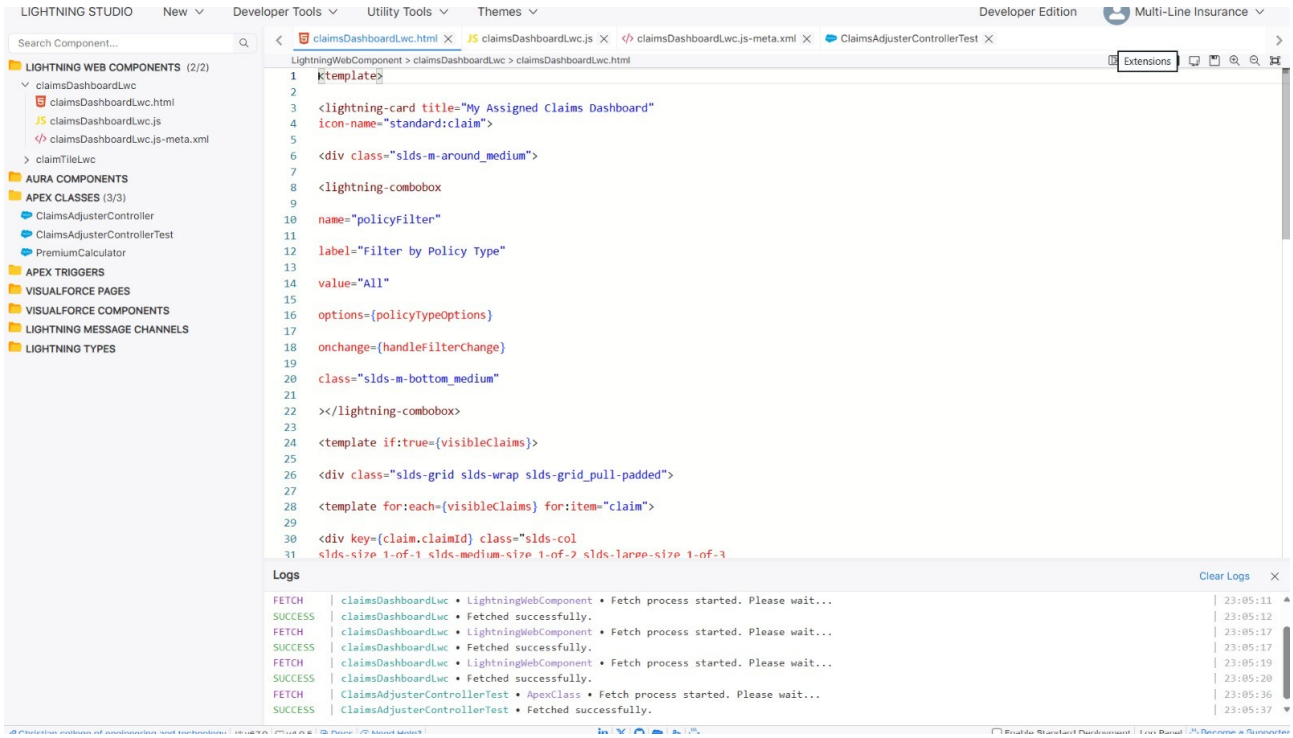

3. Implement a Screen Flow for the approvers to quickly review details and approve/reject directly from the Claim record.

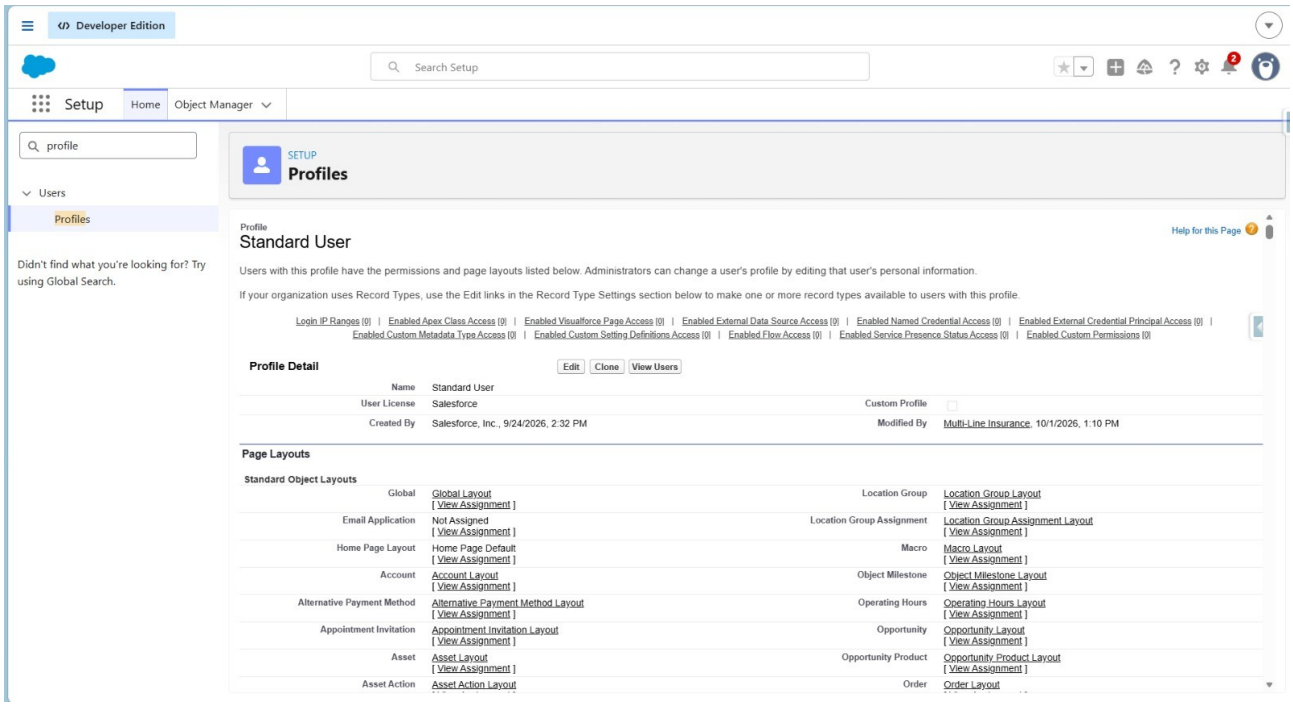

4. Write an extensive Apex Test Class for the ClaimsAdjusterController with 95%+ code coverage. Include test methods for complex claim filtering and data retrieval logic.

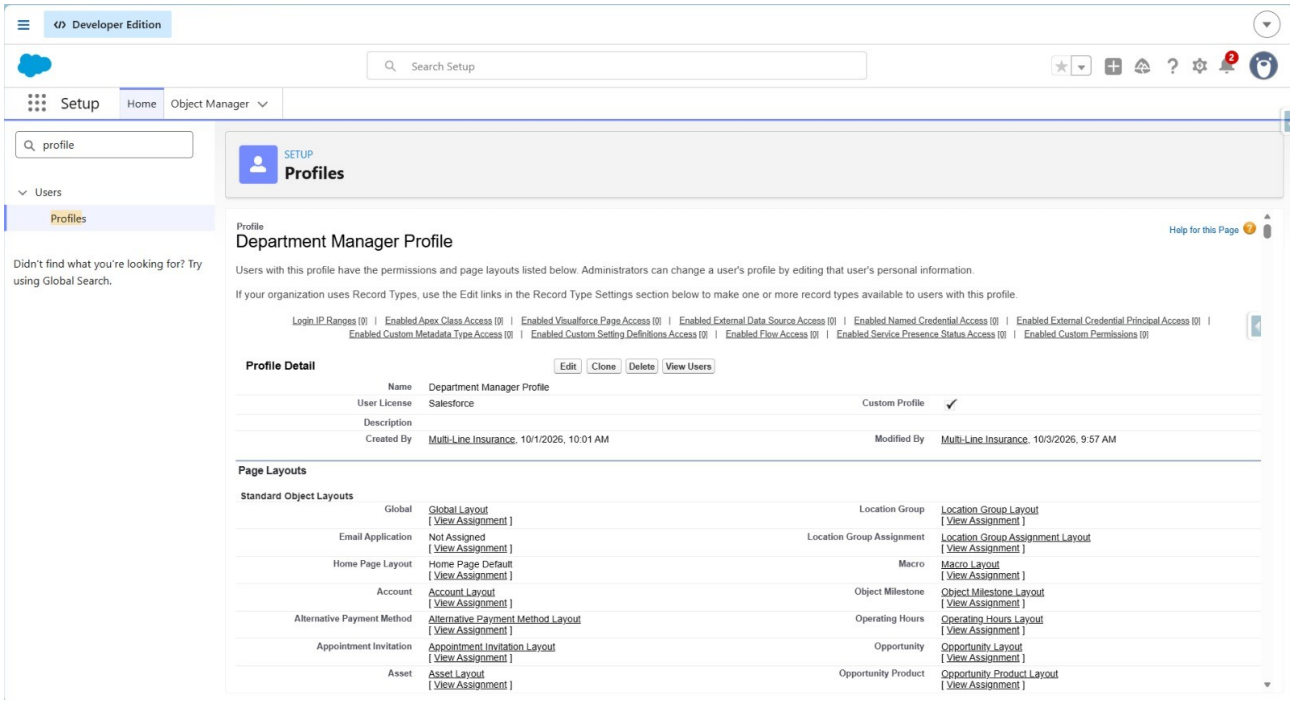

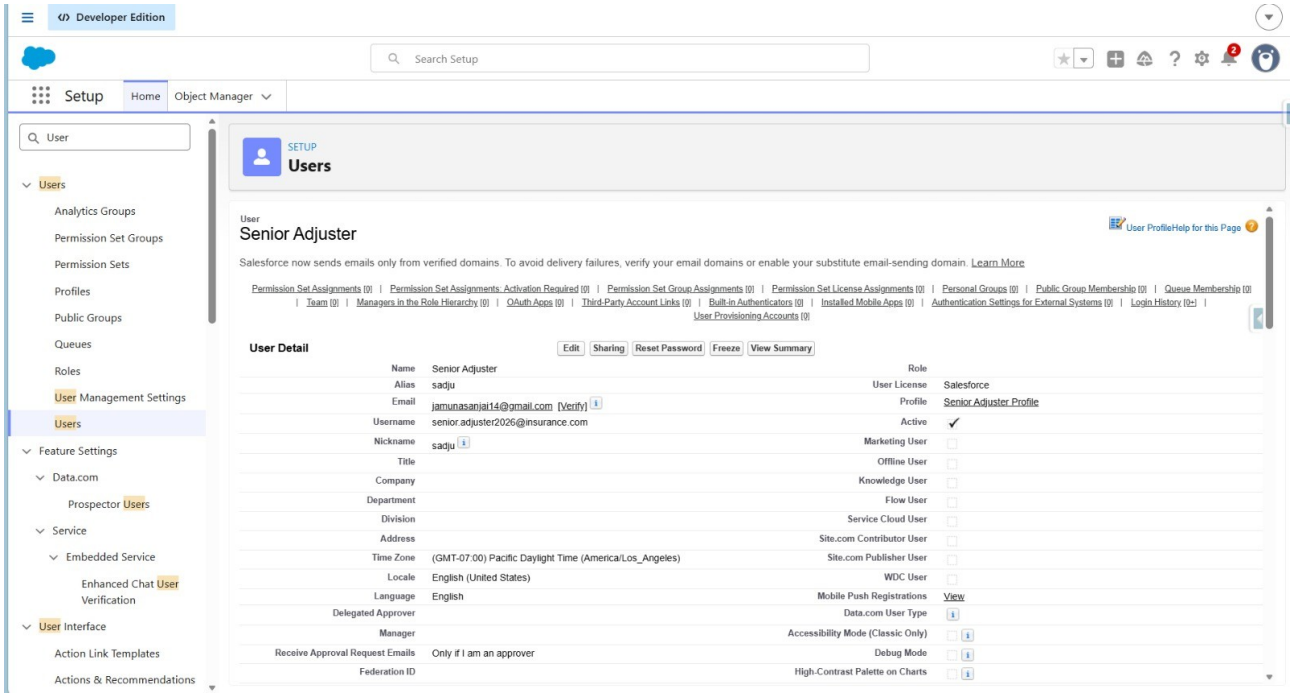

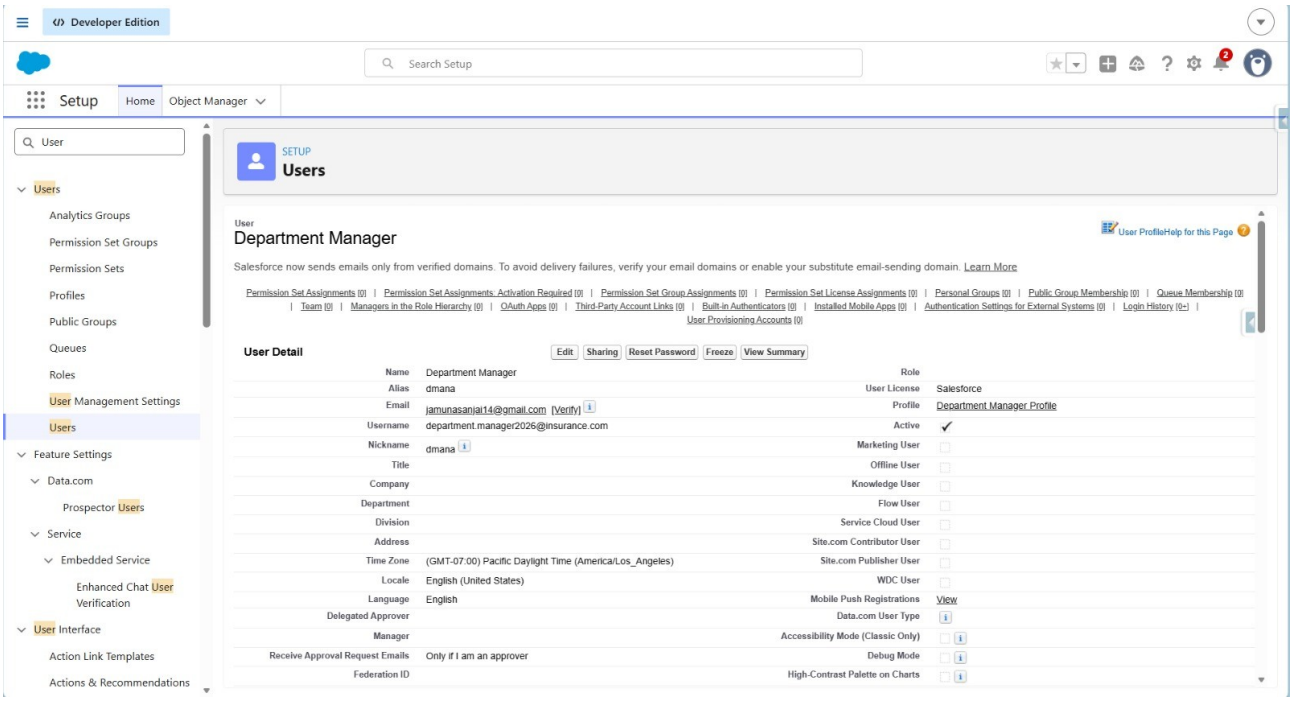

5. Refine the Sharing Rules to ensure Adjusters only see claims in their assigned territory/state.

6. Finalize all Permission Sets to differentiate access between Agents (Quoting only), Adjusters (Claim handling), and Managers (Reporting/Approvals).

7.FUNCTIONAL & PERFORMANCE TESTING

The Multi-Line Insurance Policy and Claims Management System was tested to check whether the main features work correctly.

- Customer creation and customer information updates were tested.
- Insurance product creation and management were tested.
- Insurance policy creation and status updates were tested.
- Policy renewal and expiry-related processes were verified.
- Claim creation and claim status updates were tested.
- Premium payment information and payment status were checked.
- Salesforce Flows and automated processes were verified.
- Data retrieval and user permissions were checked.
- AgentForce AI responses for policy and claim-related queries were tested.
- Reports and dashboards were verified.

8. ADVANTAGES

- Centralized customer and insurance information.
- Supports multiple insurance lines such as Life, Health, Motor and Property Insurance.
- Easy insurance policy management.
- Easy claim registration and status tracking.
- Reduces manual work through automation.
- Provides quick access to policy and claim information.
- Automated policy renewal and expiry reminders.
- AI-based assistance through AgentForce.
- Reports and dashboards help monitor policies and claims.

DISADVANTAGES

- Requires accurate customer, policy and claim data.
- Depends on proper Salesforce configuration.
- AI responses depend on available data and properly configured prompts.
- Requires appropriate user permissions and security settings.
- System maintenance and configuration updates may be required when business requirements change.

9. FUTURE SCOPE

The future improvements of the Multi-Line Insurance Policy and Claims Management System include:

- Enhance AgentForce AI for more insurance-related queries.
- Improve automated claim processing.
- Add AI-based claim fraud detection.
- Provide customer self-service through Experience Cloud.
- Add online policy renewal and premium payment facilities.

10. CONCLUSION

The Multi-Line Insurance Policy and Claims Management System provides a centralized Salesforce-based solution for managing different types of insurance policies and claims. It uses Salesforce Objects, Flows, AgentForce AI, Prompt Builder, Reports and Dashboards to manage customer, insurance product, policy, claim and payment information efficiently.

The system helps improve policy management, simplify claim tracking, reduce manual work and provide timely insurance-related information to customers and insurance staff. The use of Salesforce automation and AgentForce AI also provides a foundation for future improvements in insurance management and customer assistance.
